

Noise-Damping Flange

Our nearly unique, highly effective flange reliably prevents the transmission of vibrations and noise from the generator to the mast – right at the source! It is the perfect match for our screw mast and is compatible with all standard mast tubes with an inner diameter of 43 mm, as well as with generators that have a mounting for an outer diameter of 48-50 mm. The flange is installed directly beneath the generator and perfectly complements the mast base mounting.
